

1. Stegosaurus

Stegosaurus had a row of plates on its back. These may have helped to warn off predators and protect it along with the spikes on the end of its tail. It had a small head and a brain about the size of a plum!

*The next dinosaur
had three horns
on its head...*

2. Triceratops

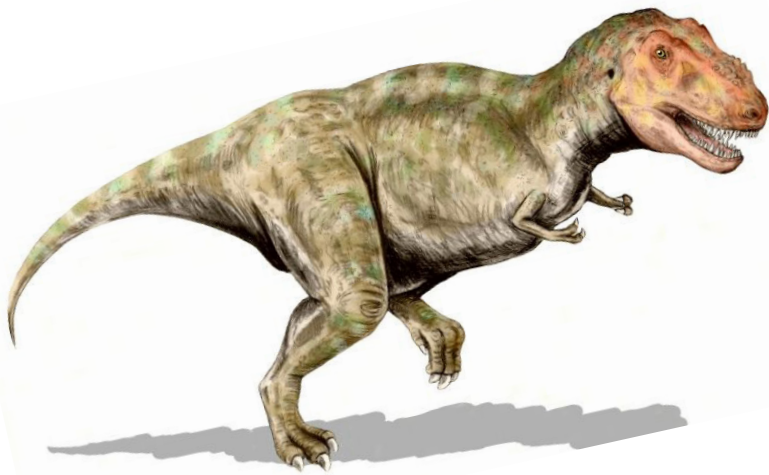

Triceratops had a parrot-like beak and used its three horns to help protect itself from bigger dinosaurs. The neck frill could reach nearly a metre across and may have been used to help them attract a mate.

*The next dinosaur
had two small
arms!*

3. Tyrannosaurus

Tyrannosaurus was a hunter with a good sense of smell, big jaws and lots of teeth! It walked on two feet and had two tiny arms which each had two extremely powerful clawed fingers.

The next creature is not actually a dinosaur!

4. Pterodactyl

A pterodactyl was a flying reptile with a wing span which could reach up to 11 metres, helping it glide through the sky. Many had claws and sharp teeth and they probably ate fish and small animals.

The longest known dinosaur is next!

5. Diplodocus

Diplodocus was a herbivore with a very long neck to help it reach plants. From snout to tail tip it could grow up to 27m long with its neck alone over 6m. Its long tail had up to 80 bones!

*The next dinosaur
was small and had
feathers...*

6. Velociraptor

The velociraptor was about the same size as a large turkey and is now thought to have had a feather-like covering, although it did not fly. It was a ground-living carnivore with claws and sharp teeth!

*The next dinosaur
had long spines on
its back...*

7. Spinosaurus

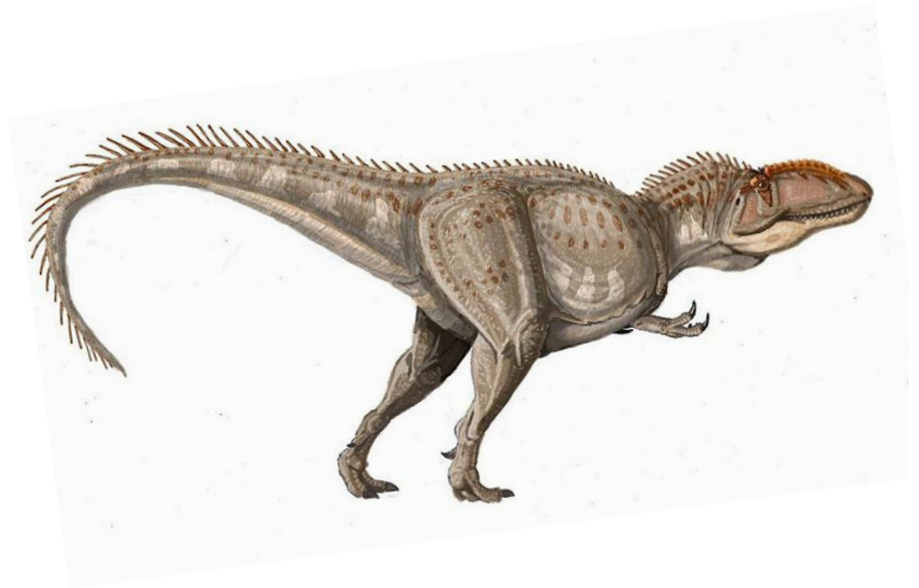

Growing up to 18m long, making it the largest-known carnivorous dinosaur. Its teeth are adapted to eating fish and the brightly coloured 'sail' on its back may have helped it to attract a mate.

The name of the next dinosaur means 'giant southern lizard'...

8. Giganotosaurus

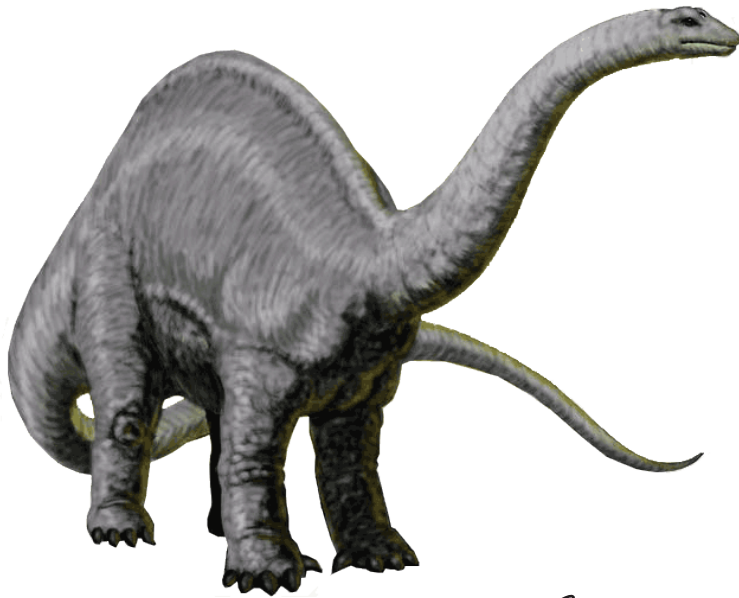

Found in South America, this is one of the largest known meat-eating dinosaurs. Probably taller and longer but slimmer than T Rex and with 3 fingers on its hands not 2, it had a brain about the size of a banana!

The next one had a long tail to balance its very long neck!

9. Apatosaurus

This giant herbivore is similar to the brontosaurus which led to scientists getting them mixed up for many years! One of the largest land animals ever, it swallowed stones to grind up its tough plant food.

*The next dinosaur
has a large crest on
its head...*

10. Parasaurolophus

This was a plant-eating duck-billed dinosaur which grew up to around 10m long. Its nostrils ran all the way through the bony crest on its head which may have enabled it to make deep booming calls.

*Do you know any
more dinosaurs?
ROAR!*
